

The wireless communication solution of Intelligent water meter

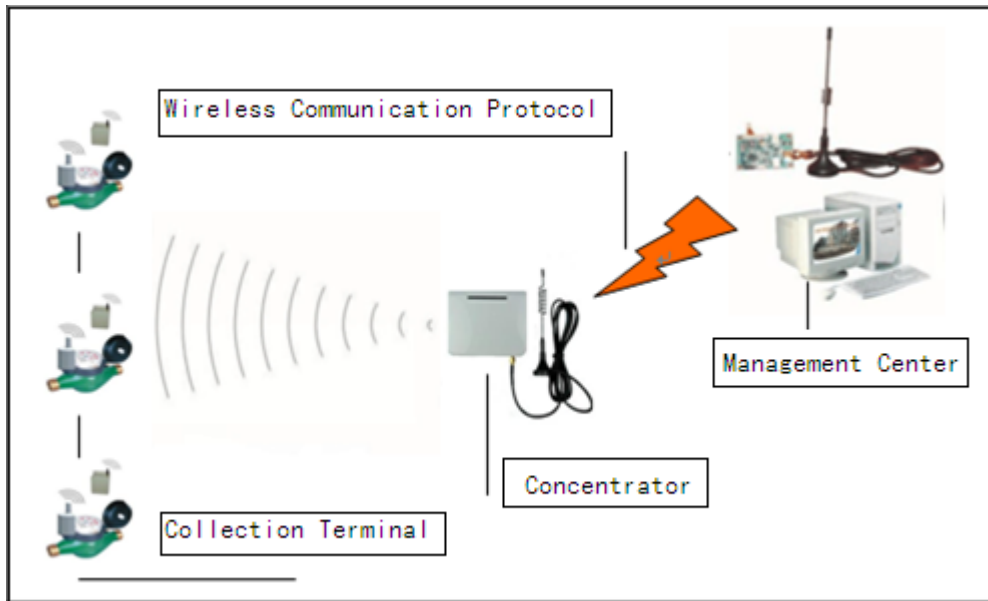

Demand analysis:

Nowadays, most of water company, still rely on copying the water meter at door. This method is not only consuming time and increasing cost, but also inconvenient to collect data. With the rapid development of intelligent wireless communication, intelligent water meter become more and more popular. It can improve the efficiency of management, prevent owing fee available, avoid copying out water amounts in consumers' home and realize water saving.

(一) Wireless remote meter reading system:

System components: It consist of meter reading management center, the centralized controller and collection terminal.

The structure diagram is as follows:

1) **Meter reading management center:** It consists of the inner meter reading management computer and the background PC management software. It is the core management section of the whole wireless remote meter reading system. It is not only the manager of the entire wireless meter reading system, but also a bridge to link the marketing management system and the remote auto-reading-meter system.

2) **Concentrator:**

The concentrator is the bridge between the management center and the user terminal, serving as the middle tier of the system.

3) **Collection terminal:** also called user terminal. It is used to directly collect the data of the user and transmit the data to the centralized controller by wireless data communication. The collection terminal is installed in each building, concentrated near the water meter.

The location is as follows:
